

Project Plan: attn (v0)

Goal: A stateless Ruby pipeline to fetch, summarize, and rank 24-hour email digests.

1. Core Architecture

1. **Fetch:** `Attn::GmailAdapter` retrieves messages from the last 24 hours.
 2. **Deduplicate:** `Attn::Storage` filters against `state/processed_message_ids.txt`.
 3. **Summarize:** `Attn::Summarizer` processes content via LLM, incorporating qualitative context from `evaluation/refs/`.
 4. **Rank:** `Attn::Ranker` categorizes output based on `SCORING.md`.
 5. **Output:** `Attn::DigestRenderer` generates a Markdown report in `output/runs/[TIMESTAMP]/`.
-

2. Directory Structure

```
““text . bin/attn # Entry point config/ attn.yml # Active configuration
attn.yml.example # Template evaluation/refs/ PREFERENCES.md # User Interests (Markdown)
SCORING.md # Quality Benchmarks (Markdown) lib/attn/
adapter_factory.rb # Source mapping gmail_adapter.rb # Gmail API interface
ranker.rb # Logic for categorization digest_renderer.rb # Markdown template
engine runner.rb # Orchestration logic storage.rb # File I/O and State
summarizer.rb # LLM interaction logic output/ runs/[TIMESTAMP]/ # Records,
Summaries, and Digest state/ # processed_message_ids.txt
```
